a biological warfare agent bwa is a microorganism or a toxin derived from a living organism that causes disease in humans plants or animals or that causes the deterioration of material the effectiveness of a bwa is greatly reduced if the attack is detected in time for the target population to take appropriate defensive measures therefore the ability to detect a bwa in particular to detect it before the target population is exposed will be a valuable asset to defense against biological attacks the ideal detection system will have quick response and be able to detect a threat plume at a distance from the target population the development of reliable biological standoff detection systems therefore is a key goal however testing biological standoff detection systems is difficult because open air field tests with bwases are not permitted under international conventions and because the wide variety of environments in which detectors might be used may affect their performance this book explores the question of how to determine whether or not a biological standoff detection system fulfills its mission reliably if we cannot conduct open air field tests with live bwases
